<b>Description</b>			
Create classes to find and display the available documentation for installed modules or suites.			

History

#1 - 04/13/2010 04:12 PM - debi staggs

This bug is now complete. When a developer publishes a suite, they just have to place a file that is named with the same name as their suite in suite name > resources > documentation. When the user selects 'Modules Documentation' from the Help menu a list of active modules is displayed. The user clicks on the module that they would like to view the documentation for, and Kepler will automatically find the appropriate documentation file, open the browser in a new window, and display the documentation. If the file is not found, there is a user dialog that states the file was not found, and directs them to the Wiki for further information.
