

Metacat - Bug #4649

Metacat couldn't update a document from client, which previous versions only stay in xml_revisions table

01/06/2010 03:06 PM - Jing Tao

Bugzilla-Id:	4649		

Description

Metacat has document tao.14334.2 and tao.14334.1. However they all were deleted. That means they stay in xml_revisions table, rather than xml_documents table.

When client uploads tao.14334.3 to metacat as "UPDATE" action, metacat will give an error:
edu.ucsb.nceas.metacat.McdbDocNotFoundException: Document not found:tao.14334

Here are steps how to produce the bug:

1. Open morpho and use new data package wizard to generate a very simple eml document.
2. Save the document to both local and metacat and get docid foo.23.1.
3. Go Documentation|title & abstract menu, modify the title.
4. Save the document to both local and metacat, get docid foo.23.2
5. Go to File|Delete menu, delete the network copy.
6. Then try to save to network again.
7. Since docid was conflict, user will given options to choose - increase revision and increase docid.
8. Choose increase revision number.
9. User will get the error:
edu.ucsb.nceas.metacat.McdbDocNotFoundException: Document not found

History

#1 - 01/25/2010 03:09 PM - Michael Daigle

Updated the code to return a more meaningful message ... that the document had been deleted and cannot be updated.

#2 - 01/25/2010 03:09 PM - Michael Daigle

resolved
