Description			
<p>My current auth namespace is 3371. I have a file with an old auth namespace of 1347. If I open the XML file, view LSID, and roll revision, then generate a report and attempt to save the KAR, I get an error saying it can't be saved because the report is NULL. If I open the XML file, view LSID, new object ID, then generate a report, I can save the KAR as expected. If I open the XML file, delete an actor then undo, then generate a report, I can save the KAR as expected.</p> <p>Thing seem to work fine if the auth namespace is the same.</p> <p>What's the difference between roll revision and new object ID, why do we need 2, and why doesn't roll revision seem to work in this case.</p>

This sounds like a WRP specific issue. Reassigning to Ben for the meantime.

Oliver the short answer to having Object ID and revision is that having both provides a finer level of categorization and increases the number of unique ID's that you can generate in one namespace.

At 23040, the revision buttons no longer seem to exist, so I guess these exact symptoms will no longer occur. I'm not sure if the underlying problem has been resolved, but it may have been fixed with 4682.
