# Kepler - Bug #4884

## Trying to log into IPCC anonymously causes Kepler to freeze, and require a force quit.

**Description**

If you do a search from the data tab for 'IPCC' and then try to log in anonymously, it looks like it is trying to connect, but then can't, after which Kepler freezes and requires a force quit.

**History**

**#1 - 03/16/2010 12:06 PM - Jing Tao**

I just tried to search "IPCC" on data tab (logged in anonymously), it worked fine to me. Can someone else make a try?

**#2 - 03/16/2010 12:15 PM - Derik Barseghian**

On wrp trunk on mac 10.5 with kepler launched from eclipse with VM arg: -Xmx1500m, I have all datasources selected except for DIGIR, and did the search, clicking login anonymously twice (KNB and then DEV). The search seemed to take a long time (~20s?), but it eventually returned 1002 results...no crash.
Though I believe I've had such a lockup and crash in the past. Maybe we can test some more and try to find the cause...

**#3 - 03/16/2010 12:56 PM - Chad Berkley**

Just tried this in the 2.0 branch and it worked for me.  Debi, were there any other circumstances that could have contributed to your crash?

**#4 - 03/16/2010 04:31 PM - debi staggs**

Could have been because I did have several workflows open ?  I just tried it now, and was successful.  Maybe we can close this bug for now.

**#5 - 03/17/2010 10:59 AM - Chad Berkley**

I just tried this under various circumstances and was not able to get it to crash.  I'm going to close this for now, but if it pops back up, feel free to reopen.
