Kepler - Bug #4887

If a module is added to a configuration, the error message should include the fix

Description

Apparently, the dataturbine module was added to the kepler trunk.

After doing
ant update
ant run

I got:
run:
[run] Error: The following modules are missing:
[run]   dataturbine

The fix is to do
ant change-to -Dsuite=kepler
ant run

It would be nice if the error message would tell the user to do an
ant change-to

Even better, it would be nice if the system would get the module.
