History

#1 - 04/28/2010 01:26 PM - Chad Berkley

changing title to rc2

#2 - 05/07/2010 11:57 AM - jianwu jianwu

It works when I installed it in Windows 7 64 bit. One only issue I found is that the generated desktop icon is not Kepler icon, but a file icon. The correct icon will be created if I separately create a desktop icon from the installation directory.

#3 - 05/07/2010 03:19 PM - Jing Tao

On window 7, kepler desktop icon is a blank page.

#4 - 05/07/2010 03:41 PM - Jing Tao

Jianwu, can you start the kepler on windows 7. I can install it successfully. But it can't be started.

Last time, RC1 could be installed and started.

#5 - 05/07/2010 03:58 PM - jianwu jianwu

Jing, I have to right click the icon and use 'Run as administrator', or start cmd using 'Run as administrator' and execute the Kepler.bat. Otherwise, it will have access denied exception:

```
Exception in thread "main" java.io.FileNotFoundException: C:\Program Files\Kepler-2.0-RC2\build-area\present.txt (Access is denied)
```

...

#6 - 05/07/2010 04:59 PM - Jing Tao

Yep, if I right click the icon and choose "Run as the Administrator", kepler will start. RC1 doesn't need this. I think this is a bug.

#7 - 05/07/2010 05:05 PM - jianwu jianwu

Hi Jing, I agree with you. Normally users do not use 'run as administrator' much.

#8 - 07/07/2010 04:18 PM - Christopher Brooks

I'm closing this tracking bug because all the blockers for this bug and 2.0.0 are fixed.

BTW - I find it easier to use the target field for releases and to use a blocker bug for smaller feature sets that are pre-release. The primary reason is that Bugzilla makes it easy to search for bugs by target and include info such as the time estimate. The "Show dependency" link for blocking bug does not give quite as much info.
