

EML - Bug #498

check root element names for consistency

05/01/2002 06:11 PM - Matt Jones

Description

Changes as decided upon at the Sevilleta EML meeting, April 24-25, 2002:

1) check root element names for all modules to be sure they are consistent. Some now use an "eml-" prefix, others don't. My notes from the meeting indicate that we should make the root elements all camel caps, and get rid of the "eml-" prefix (although the file names would keep the prefix). I'm not positive that I go tthis right, though. Opinions?

History

#1 - 05/01/2002 06:13 PM - Matt Jones

Looking at Corinna's notes, she says we decided to keep the "eml" but remove the "-", so that root elements would be of the form: "emlLiterature". Does that mean that we have "emlDataTable", contrary to what the bug for eml-entity says we decided (dataTable)?

#2 - 05/10/2002 01:43 PM - Chad Berkley

Unless anyone has objections, I'm going to change all of the roots to just use camel notation without the eml. For instance tableEntity not emlTableEntity and not eml-tableEntity. If there are any objections tell me by Monday. I'll make the changes on Tuesday to give people time to respond.

#3 - 05/20/2002 01:40 PM - Chad Berkley

changed all roots to just the name of the file without eml- using camelCaps where appropriate. I'm unsure what to do with eml-literature because the root is currently called 'citation' instead of 'literature'. Should I change it?

#4 - 06/13/2002 06:53 PM - Matt Jones

ok, checked and fixed. In CVS.
