Target version:	2.4.0	Spent time:	0.00 hour
Bugzilla-Id:	5072		
Description			
(8) Move the R module out of Kepler/CORE entirely. Set up the module manager to handle the R installation process when a suite including the R module is downloaded without requiring the user to handle installation manually. Move getting-started workflows that use the R actor out of Kepler/CORE into the r module.			
The R module does not add anything to Kepler unless R is installed. Also, often the exact version of R that is required matters. A mini-installer would be able to ensure that the user downloads a compatible version of R for use with Kepler.

As per Kepler leadership discussion, moving this to 2.2.0. Note that we will have Kepler devel telcon to discuss 2.1, so I'm leaving this as blocking 5064.
