Description			
(9) In module manager, display the current suite name as well as a fully resolved list of modules.			
The module manager currently displays the content of modules.txt. If modules.txt refers to other suites, it is not possible to tell what modules are actually in use. Also, it is not possible to tell what the current suite (if it is non-custom) is currently selected. The module manager display would be more useful if it displayed this information.
