

Kepler - Bug #5093

module manager can leave kepler in broken or unexpected states

07/14/2010 10:54 AM - Daniel Crawl

Status:	Resolved	Start date:	07/14/2010

Bugzilla-Id:	5093		

Description

The module manager lets one "change to" individual modules instead of only suites. This can lead to a situation where kepler cannot be started. (This happened to me when I selected only the data-handling-2.0.0 module).

Additionally, more than one suite can be selected at a time. However, it appears that only the first on the list is used. (I selected tagging and reporting, with tagging being first, and ended up with only tagging).

History

#1 - 10/28/2010 06:42 AM - David Welker

This is finally done. The module manager can always be run in stand-alone mode. What is left is to invoke the module manager appropriately from the different operating systems. Work on Mac OS X is finally complete. Will need to work on Windows and Linux. Since the work that remains is better classified as being under installers, I am closing this bug.
