Description

I've given the mac installer a try and I've run into the configuration file issue - my ~/KeplerData/repository/configuration/configuration.xml does not contain the new properties authorizationPath or authenticatedquerypath and I get errors as a result. I also don't see old versions of my configuration files -- I believe the workaround that you implemented for http://bugzilla.ecoinformatics.org/show_bug.cgi?id=5129 was that the old configs are supposed to be moved out of the way on the first startup of 2.2.

Here's what I did:

```
cd ~/kepler.modules/build-area/; ant clean-all; rm -rf ~/KeplerData;
```

Start up previously installed Kepler 2.1.0 from Applications

Change my Components Sources to search the Kepler repository

Change Kar Preferences to Strict

Search for sdf. Create and run a simple workflow

Quit

Start installer 2.2.0rc1 from Applications

Clicking on the Sources button gives the below error. Attempting to search Components also gives an error.

History

#1 - 02/15/2011 10:32 PM - David Welker

I figured out the source of this problem. It isn't actually in 2.0.0rc1 itself, but instead in the installer since a certain necessary file is not copied over by the installer.

This is now fixed and this problem should not show up in 2.0.0rc2.

Closing.
