Description

The current morpho UI displays a result set from a default query as its principal interface. We decided to change this to instead display a "data-oriented" view of a single package. In this new UI, each package is represented as a document in a single window. Multiple windows can exist at once so that more than one package can be displayed (need to decide if these should be internal to a single frame or whether each should be its own JFrame, in which case the menus etc need to be reproduced as well). Tabs at the bottom of the window allow one to switch among spreadsheet views of the different entities. Non-tabular entities could be displayed as browse images. An additional tab lets one see a view of the package metadata. Each column in the tables can be clicked somehow to see that attributes metadata. The entity metadata might be displayed at the top of the view. I will also file a bug for rearranging the File|Open dialog.
