Description

It sounds like provenance trace files are going to start being included in the provenance database, per execution.

Workflow Run Manager could then include trace files in run-kars, creating more comprehensive archives.

This probably only really makes sense to do if we can do something useful with the tracefile in the kar. I'm imagining the Provenance Browser could(can?) be invoked from the trace file directly. Or, we could consider importing the data from the trace into the provenance db.
