Kepler - Bug #5336

If a user chooses "no metadata" as output format in Database Query actor, the query result only shows one column no matter the query specifies to select two or more columns

Description

If user chooses the output type as "no metadata" (no column name will be shown in the result), and query looks like "select id, lastTime from sensors where id='sensor0', the result only shows:

```
sensor0
```

The lastTime column is missed even though the sensor0 does have a value at the lastTime column
