Description

If a data package was created by a morpho in metacat epsilon and it was forced replicate from metacat epsilon (its homeserver) to metacat pine. Then same user use a Mophor point to metacat pine and can find this data package. If the user try to update the dataset document will cause an error:

The root element is required in a well-formed document.

However you can update other xml documents such as access, physical documents in the same package successfully.

If user create a new data package in metacat pine and he can update dataset xml document successfully.

In write method of DocumentImpl class, the code to handle the satuiation that doc's homeserver isn't local and action = insert need a return statement.

Otherwise it be parse twice. So add the statement, everything is fine.
