History

#1 - 08/05/2011 04:22 AM - unknown unknown

Also happens with Menu: Window -> Runtime Window -

```
[null] ERROR (org.kepler.gui.MenuMapper:getActionFor:269) Exception trying to create an Action for classname:
<org.kepler.gui.RunWithFeedbackChkBoxAction>;:
[null] java.lang.IllegalArgumentException: RunWithFeedbackChkBoxAction constructor could not get actions
for DEBUG->ANIMATE EXECUTION or DEBUG->STOP ANIMATING (java.lang.reflect.InvocationTargetException)
```

#2 - 08/06/2011 03:57 AM - unknown unknown

Has changed a bit in trunk (revision 28231):

```
[run] Using default context menu stuff for class: ptolemy.kernel.ComponentEntity
[run] ERROR (org.kepler.gui.MenuMapper:getActionFor:295) Exception trying to create an Action for classname:
<org.kepler.gui.RunWithFeedbackChkBoxAction>:
[run] java.lang.IllegalArgumentException: RunWithFeedbackChkBoxAction constructor could not get actions for DEBUG->ANIMATE EXECUTION or
DEBUG->STOP ANIMATING (java.lang.reflect.InvocationTargetException)
```

It's ubiquitous, so it's less important which Kepler function I choose.

#4 - 11/03/2011 07:20 PM - Daniel Crawl

Fixed in r28869. RunWithFeedbackChkBoxAction was expecting the Ptolemy actions Debug->Animate Execution and Debug->Stop Animating to always be present; whenever a window opened that did not have these actions, e.g., an actor documentation window, RunWithFeedbackChkBoxAction would throw an exception. Interestingly, this problem has existed since Kepler 1.0, but MenuMapper only recently started displaying the exception.
