VegBank - Bug #565

Balance HTML and enforce 800 width table webpage format

08/21/2002 05:28 AM - Robert Peet

Description

1. Webpage headers and footers should be adjusted so that width conforms to the needs of a 1024 screen setting. There is a bit of overhead in browser margins and slider bars, so we cannot use the full 1024. My new draft of the index page has a table width of 971, but nothing special about this.

2. Once we select a table width for headers and footers, we should try to embed the rest of the text in table cells of hte same maximum width so that we do not lose aesthetic integrity owning to self-adjusting width of html rendering. For example, all the text within the ~/vegbranch/vegbranch.html that has been added moves around as the browser is resized so that the headers and footers do not appear to fit correctly. Would not be much hassle to construct all such pages as simple tables.

History

#1 - 08/29/2002 10:13 AM - Michael Lee

The larger horizontal screen size was decided against. Leaving this as is.

Changing structure of pages so as to embed a table and prevent text from extending beyond header and footer still must be completed.

I agree

#4 - 05/02/2003 04:36 PM - Michael Lee

Forcing everything into a 800 wide table would mean that we have to have balanced html. Which we need to do eventually. So it goes in this bug, too.

What I had previously envisioned was adding to the top of each page, in the vegbank header token:
<table border="0" width="800"><tr><td>

adding to each footer, via the footer token:
</td></tr></table>

But this will only work if all our html is balanced, which is it not. We need to balance the html and then attempt this, as this could result in weird formatting, which sometimes happens in html that isn't balanced (tables beside one another instead of one below the other)...
