I ran into a few issues updating EcogridWriter documentation using:
./kepler.sh -updateActorDocs actors/resources/kar/CoreActors/EcogridWriter.xml

1) the actor LSID revision wasn't incremented (and the corresponding entry in CoreActor's manifest). Maybe simply a warning should be printed.

2) port documentation didn't show up in kepler, because the variable names for the ports were used, instead of the assigned names. Using the variable (default) names like this is probably the best though, since port names can be dynamically created, as can ports themselves. But the target should probably print out a warning that the developer should check/fix port doc by hand.

3) special chars were inserted for linebreaks (not that line breaks seem to get displayed anyways)

Bonus enhancement request:

4) it would be cool if the resulting xml were run through a 'pretty print'.

Blocks Kepler - Bug #5687: investigate alternatives to workflow versioning

1) Why does the LSID revision always get incremented? We should first decide how workflow versioning in general should be done. I'm adding a dependency on bug #5687.

2) I think the LSID revision should get incremented whenever the actor changes to make it easier (still not easy enough) for the user/developer track down any workflow behavior change issues to do w/ a specific actor; they'd have available this identifier marking changes, and could look into svn to see what the changes consisted of if they really wanted. And because I thought the idea behind our using LSIDS was to identify an unchanging entity. I agree the group should discuss and come to a consensus. I try to always increment LSIDs when actors change based on this informal idea, but others don't, so it's not a functional concept right now. It's also too easy to forget to do it. It would be cool if actor versioning were automatic, and if actors all included a changelog.

3) Original Bugzilla ID was 5690
