Kepler - Bug #5691

parameter choices are not saved

08/20/2012 04:27 PM - Daniel Crawl

Description

The choices for Parameter.addChoice() are not written when the model is saved.

History

If I add choices to a parameter in a workflow, I would like those choices available the next time I open the workflow. I was able to accomplish this by manually adding an EditableChoiceStyle containing each choice, e.g.:

```xml
<property name="control" class="ptolemy.actor.parameters.PortParameter" value="Local Execution">
  <property name="style" class="ptolemy.actor.gui.styleEditableChoiceStyle">
    <property name="choice1" class="ptolemy.data.expr.StringParameter" value="Map Reduce">
    <property name="choice2" class="ptolemy.data.expr.StringParameter" value="Map Only">
    <property name="choice3" class="ptolemy.data.expr.StringParameter" value="Cross Reduce">
    <property name="choice4" class="ptolemy.data.expr.StringParameter" value="Job Submission">
  </property>
</property>
</property>
```

I have to manually add and remove the choiceN parameters; it would be nice if this were automatically done. I'm lowering the priority and retargeting.
