

Metacat - Feature #6050

Use the spring application-context xml file from d1_cn_index_processor.

Description

We copied the application-context-systemmeta100.xml, application-context-systemmeta064.xml, eml and fgdc files from d1_cn_index_processor svn server to the metacat-index svn server. So if there are some changes in those files in the d1_cn, we need to commit the change to the metacat-index as well. The code were duplicated.

We changed to use the ClassPathXmlApplicationContext rather than FileXmlApplicationContext and the metacat-index can use those files in the d1_cn_index_processor.jar.

The only files are kept in the metacat-index is the application-context-resource-map.xml and index-processor-context.xml. They are different than the ones in d1_cn_index_processor.
