Description

When Morpho is displaying a package, several of the menus that work for the result set window should also work for the package. These include the synchronize, delete, and export menus. Need to verify that each of these menus is active when a data package window is open, and to make sure they work properly. Fix them if they don't.

Now synchronize, delete, export and openPreviousVersion menu worked well in data pakcage frame too.

Now MorphoFrame are divied tow parts: search result and data package. From them we can get tow different Objects: ResultPanel and DataViewContainerPanel. From these panels, we can get information such as selected docid, location(local or network) and so on. The information can be passed to DataPackageInterface to do synchroinze, delete, export and open previouse version. The above procedures were finished in different Command classes.
