Description

These are the fields we have in the schema:

```
<field name="family" type="string" indexed="true" stored="true" multiValue
d="true"/>
<field name="species" type="string" indexed="true" stored="true" multiValu
ed="true"/>
<field name="genus" type="string" indexed="true" stored="true" multiValue
d="true"/>
<field name="kingdom" type="string" indexed="true" stored="true" multiValu
ed="true"/>
<field name="phylum" type="string" indexed="true" stored="true" multiValue
d="true"/>
<field name="order" type="string" indexed="true" stored="true" multiValue
d="true"/>
<field name="class" type="string" indexed="true" stored="true" multiValue
d="true"/>
```

They should all be searched with the value specified in the Taxon box. Also should consider having auto-complete for this box pulling from each of those facets.

History

#1 - 10/25/2013 11:59 AM - ben leinfelder

- Description updated

#2 - 10/25/2013 12:53 PM - ben leinfelder

- Status changed from New to Closed

- Assignee set to ben leinfelder

Now searching on the 7 taxonomic fields and including them as autocomplete sources in the Taxon search filed.
