Description			
If we have access to a Windows XP machine I would like to test is reducing the number of rows in the Solr query to 200 or so is enough to make it usable in this OS. If not, we'll have to determine the issue and consider whether it is efficient to fix for an OS that is over 10 years old.

IE 9+, Firefox, and Chrome all handled the KNB website (currently metacatui 1.4.2) well. IE8 had an error that stopped the result list and map from loading, so I've created a new ticket for that. But it seems all as ok for Windows XP.
