Description

We may create a `~/.morpho/certs` directory and have a simple UI for users to drop certificates to the directory.

On startup, morpho looks in that dir and adds any CA certs it finds to the keystore, and keeps track of them, so if the user removes one then it removes it from the truststore on next restart.

The `d1_libclient` already has some features. The `d1_libclient` does this all dynamically at runtime - it does not actually write entries to the truststore, just merges them for runtime use
