

Morpho - Bug #660

Change file/directory chooser action for "Export"

10/29/2002 11:54 AM - Dan Higgins

Status:	In Progress	Start date:	10/29/2002
Priority:	Normal	Due date:

Bugzilla-Id:	660		

Description

Currently, the user is asked to select a directory where an 'Exported' package is to be saved. The file chooser dialog for selecting a 'directory' is somewhat confusing since few applications require the selection of a directory (instead of a file) and, on the Mac one actually has to type in a directory name. (probably a bug in the JVM).

Recommend a change where the user is presented with a default file name for the 'metadata.html' file in an ordinary 'file chooser' (not a directory chooser).

User can then select the directory for the file or change its name using normal file saveing procedure. This 'index' file is then saved along with accompanying directories just as is currently done.

How would this work for zip exports? wouldn't we allow them to name the zip file rather than the html file? I think this should be very low priority -- it works for now. Changing to Postpone.
