#### Description

The apple-extensions module does not compile with java 8 because the package com.apple.eawt is no longer on the default classpath. Prior to java 8, these classes were in ui.jar, but are now in rt.jar, which is not used by javac. I tried explicitly adding rt.jar to the classpath, but javac still fails.

A workaround is to comment out this module from the Kepler suite.

#### History

**#1 - 08/12/2015 03:32 PM - Daniel Crawl**

- Status changed from New to Resolved

Apple no longer supports the API used this module, so I've removed it from the Kepler suite.
