Kepler - Bug #6681

unnecessary warnings when removing parameters

03/02/2015 02:03 PM - Daniel Crawl

Description

When a parameter is removed that is referenced by something else, a warning is displayed to the user (in Variable.setContainer()). However, there are situations where the reference should be ignored. For example, the Kepler provenance recorder has a reference to all the parameters in the workflow. Another example is PtolemyQuery in attachParameter().

Attached is a patch to avoid these unnecessary warnings.

History

#1 - 03/02/2015 04:18 PM - Christopher Brooks

- % Done changed from 0 to 90

The patch to make warnings about deleting variables more selective seems reasonable to me, so I patched the ptII tree with r71667.

Please feel free to close this.

#2 - 03/04/2015 10:34 AM - Daniel Crawl

- Status changed from New to Resolved

- % Done changed from 90 to 100

Thanks for applying the patch, Christopher.

I updated ProvenanceRecorder to use the new API to prevent unnecessary warnings in r33267.
