Description			
<p>We had two testers who provided feedback the provenance and metadata display. Overall the feedback was positive. Here is are the notes taken during that feedback (from Rachel Volentine):</p> <ul style="list-style-type: none">-Participants liked that the display was simple and clean.-The Prov display was clear (one of the best displays they have seen)-They did not think upload date was important. They wanted to know creation date.-They wanted some sort of symbol or icon to indicate that they are more ancestors (an arrow or something?) but they did not want the display to become too busy-They liked the idea of a tab system to indicate what information was available on the page. BUT they did not want the display to become busy/cluttered. Only do something if the display will stay clean.-They thought there was a lot of scrolling and thought it would be easy to get lost on the page. Wanted a "jump" or "back to top" button to help navigate.-Wanted date the data was created to be more prominent. Didn't really care about date uploaded or date of DOI-When you click on the ancestor you see "view", which they expected to mean you would see the R script (or other object). Recommend changing the term to "preview" or other term to mean that you see metadata instead.-They liked the idea of getting a preview of the ancestor data-One participant said "That's really clean stuff to work with" and considered that to be a big reason to return to the site.-They liked the plain English descriptions in prov-They liked the MN branding in the search
