

MetacatUI - Feature #6867

Map should be fixed width in the search view

Description So that as the user widens their browser window, the result list gets larger, not the map. Ultimately I think we'd like to have resizable columns in that view so users can customize the space each pane (filters, search results, map) takes up, but this is a faster implementation of a similar idea

The map will always be 33% of the window width. This gives the result list a lot more room to widen as the user widens their browser window
