Description The dmanclient currently prints copious debugging messages to stderr and stdout. All of these must be removed, either by eliminating them, or wrapping them in a "debugMessage" function that can be turned on and off at compile time. There is a good example of one of these utility methods in edu.ucsb.nceas.metacat.MetaCatUtil.debugMessage() -- it uses a static debug flag so that the conditional executed if the debug flag is false (Java eliminates all conditionals that are static false).			

History

#1 - 08/23/2000 11:09 AM - Dan Higgins

A simple 'fix' is to use 'javaw' to launch application rather than 'java' for user version. (User will not see messages, but developer will)

#2 - 09/26/2000 03:11 PM - Dan Higgins

All but a few initial messages can now be vectored to a 'stderr.log' file by setting the parameter 'log_file' to true in 'client.properties' file. the few initial parameters can be eliminated by launching with javac rather than java.
