sounds like this bug deals with the new implementation of confidentiality that was proposed in the Sept 2002 meeting in SBA.

#2 - 04/19/2003 09:13 AM - Robert Peet

We have from the very start known that scrambling of location because of rare species would be necessary. The implementation can include fuzing at the request of the submitor or subsequently by management from the management page.

How do we implement this?

I imagine that we need to build an auxillary table to contain species that always cause fuzzing, and also with species x state\province combinations that invoke fuzzing. We can ask NatureServe to provide us with the data to populate these tables. We need to find a simple way for management to load these tables as updates become available.

We will need to build a tool to search the data base for specified taxa in specified geographic areas and switch fuzzing on or off as requested by management.
