

EML - Bug #918

example tag in eml:documentation

11/21/2002 12:19 PM - Peter McCartney

Status:	Resolved	Start date:	11/21/2002
Priority:	Normal	Due date:

Target version:	EML2.0.0	Spent time:	0.00 hour
Bugzilla-Id:	918		
Description			
<p>Ive noticed at least one place in eml-attribute where the example tag in the documentation inlines the element name as part of the text using > and < symbols. It seems this practic is generall dropped (for good reason) so we might want to scan for the odd case where it still exists. I didnt fix it in eml-attribute because matt currently has that in a branch and i dont know where the best place to put it is.</p>

oops...the example i saw was actually for a non-leaf node in which it lookes like someone was trying to show examples for the both the leaf nodes it contains. so let me rewrite this bug to say:

it seems like we have inconsistent methods for examples for non-leaf nodes. some are empty, some have text that says in so many words "see examples for child nodes" and at least one shows an XML snippet. this might make automated processing of examples difficult if we cant predict whats going to be in there

#2 - 12/05/2002 08:00 PM - Matt Jones

DONE. Went through all xsd files and rewrote any examples that contained element names to no longer use those names.
